ELEVATING ROOF

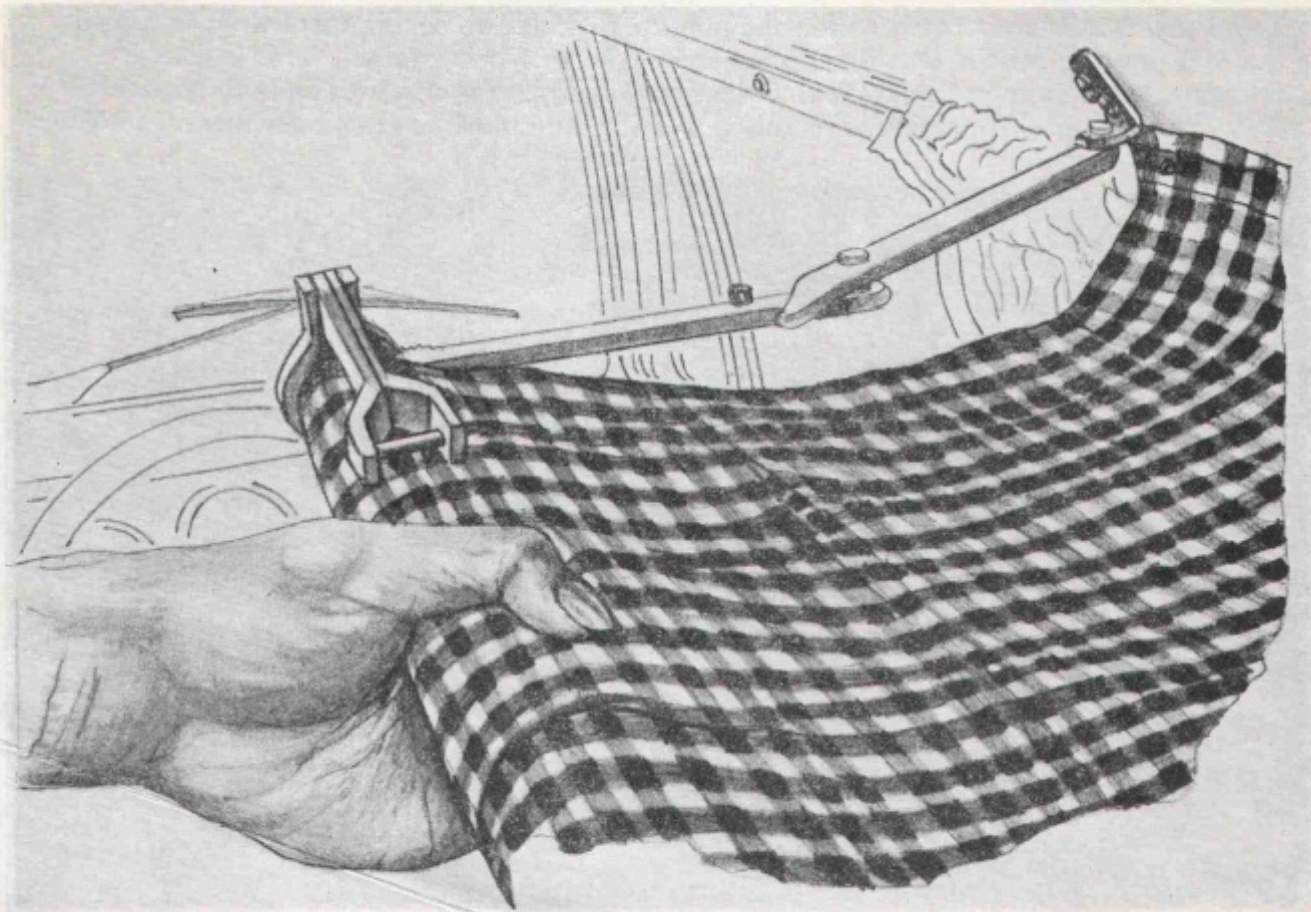

Elevating Roof

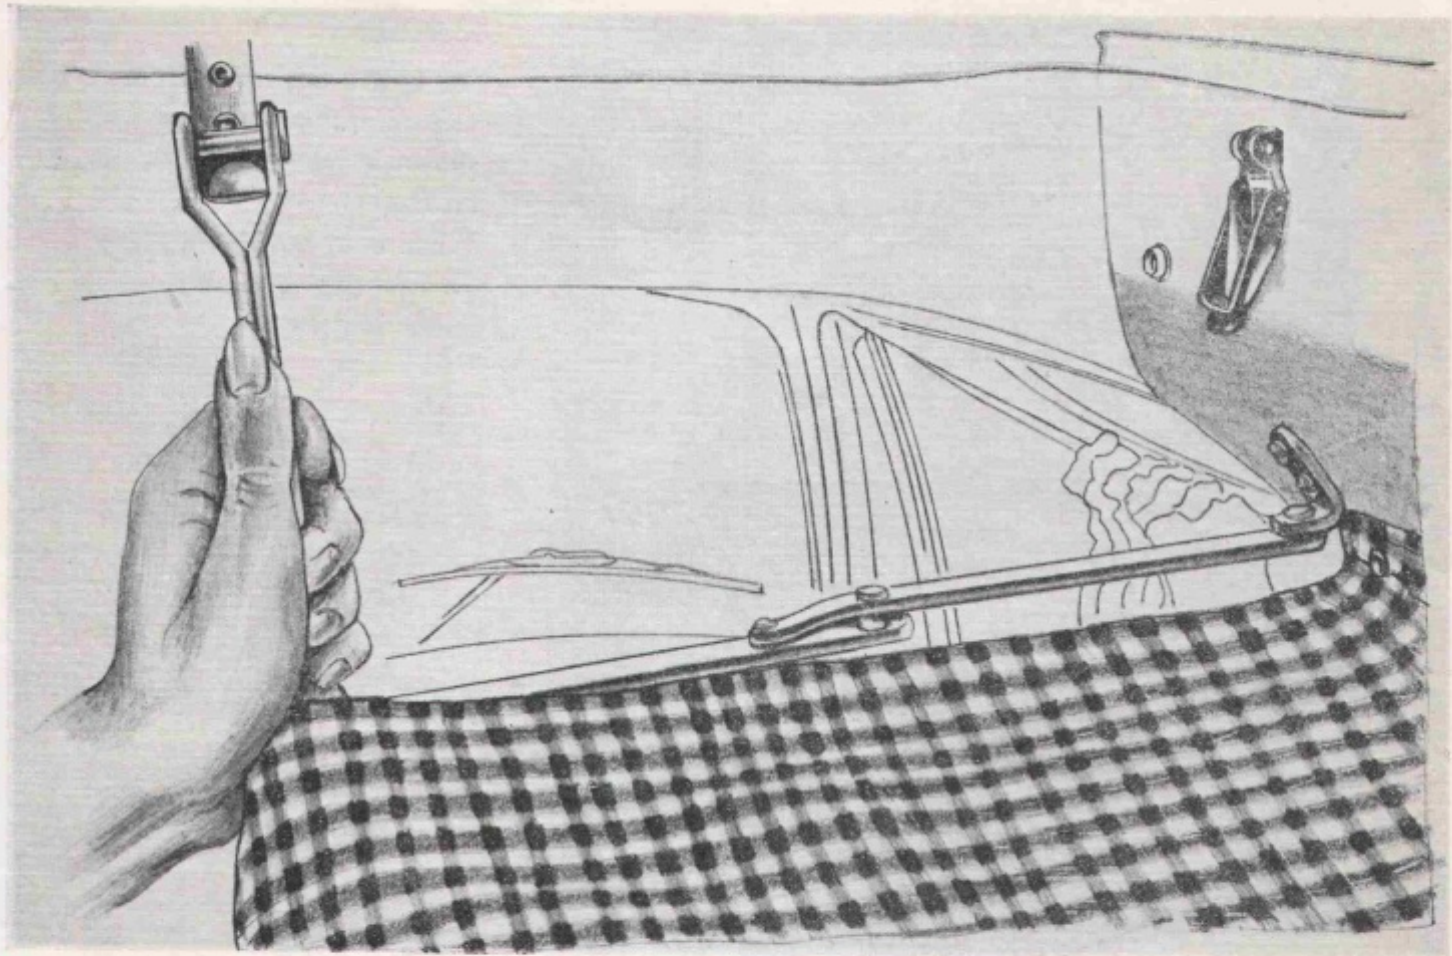

SINGLE BUNKS

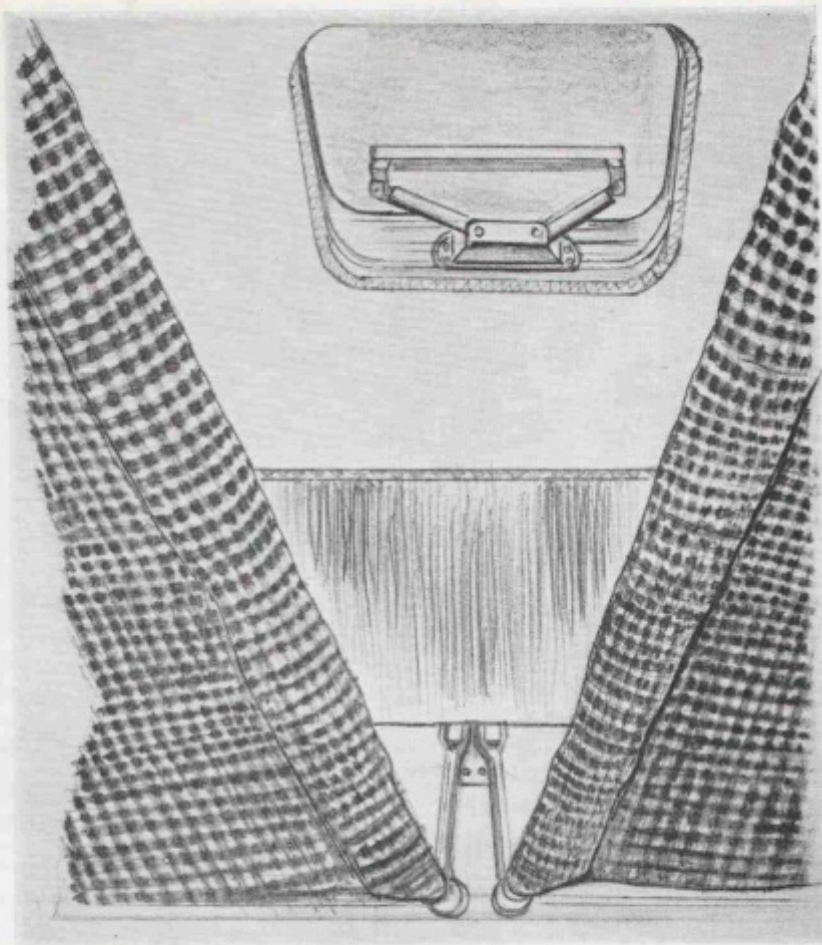

Two single bunks are located within the pop-up roof, and to enable them to be occupied the roof must be raised. Our illustration shows the roof being raised. This is done by releasing four retaining catches, two either side, and pushing upwards on both horizontal bars. The roof is self-retaining in its raised position, and must be pulled downwards to close.

Beneath retaining catches on either side is a canvas flap, held closed by press studs. Within each flap is a canvas bunk; our illustration shows one of these being extended.

Bunks are suspended from central end supports as shown in our illustration on Page 3.

When both bunks are ready for use, they appear as in our illustration.
